

Red Path Integrated Pathology moved into new headquarters at 2515 Liberty Avenue, where it occupies 20,000 square feet of sustainable, state-of-the-art molecular testing laboratories and high performance work environments. Built to “near clean room” status, the laboratories were custom designed for efficient work flow and best practices in the analysis of minute patient biopsies, thus enabling the highest levels of quality and performance.

The new location also employs the latest technological advances in customized laboratory information technology, and the space itself was built upon “green building” principles that include enhanced energy efficiency and the broad use of recyclable and recycled materials.

Jendoco worked with both the building owner and RedPath to update the space to meet current building codes and to rectify maintenance issues in the building shell.

Working with RedPath’s representatives, Jendoco’s onsite work force was able to complete the lab area prior to RedPath’s previous lease expiration.
